

The same 19 routes reorder beyond refusal

Rows are aligned exact routes and ordered only by Part 0 refusal; each panel keeps its own estimand.

Blue, orange, and green dots are task-specific point estimates; horizontal whiskers are harmful-root sensitivity intervals, stratified scenario-root sensitivity intervals, and trajectory Student-t 95% intervals, respectively. Longer colored stems mean a higher rate within that panel. A row moving left from refusal to cooperation or restraint is a model-ordering disagreement, not a decline over time. The aligned profile visualizes why refusal has weak rank association with the two beyond-refusal outcomes; no values are averaged across panels.
