

Part 2 commons outcomes for 23 exact model routes

One row per route; 12 trajectories per route; provider families are contiguous and newest route versions appear first.

Model action: equal-seed mean trajectory restraint [t95]

Resource consequence: mean AURC [t95] / env.

Group consequence: population retained [t95] / env.

The action panel is the equal-seed-weighted mean of 12 trajectory-specific all-scheduled restraint proportions; it can differ from the pooled living-agent-day proportion when attrition changes denominators. Environmental panels use only zero-invalid eligible trajectories (route-specific $n=0-12$). Whiskers are trajectory-level Student-t 95% intervals; a point without a whisker has $n=1$, and a cross marked NE has $n=0$. Invalid actions count as nonrestraint but have zero simulator effect.
