

Part 2 commons outcomes for 19 exact model routes

One row per route; 12 trajectories per route; ordered by within-task restraint rate.

The three centered bar columns connect model action (restraint), resource consequence (AURC), and group consequence (final population retained). Whiskers are trajectory-level Student-t 95% intervals. Higher values mean more preservation in this simulator. AUPC and nondepletion remain in the released diagnostics; invalid actions remain in denominators and eligibility checks rather than a separate argument-facing panel.
